Steps:

- 1 Construct scale-space.
- 2 Detect scale-invariant interest points from scale-space extrema.
- 3 Orientation match.
- 4 Compute descriptor.
- 5 Match image descriptors.

Construct scale-space

Interest points are obtained from a difference-of-Gaussians pyramid.

Construct scale-space

Smoothed image values:

$$L(x, y, \sigma) = G(x, y, \sigma) * I(x, y) \quad (1)$$

Gaussian kernels:

$$G(x, y, \sigma) = \frac{1}{2\pi\sigma^2} e^{-\frac{(x-m/2)^2 + (y-n/2)^2}{2\sigma^2}} \quad (2)$$

The difference-of-Gaussians operator:

$$\begin{aligned} D(x, y, \sigma) &= (G(x, y, k\sigma) - G(x, y, \sigma)) * I(x, y) \\ &= L(x, y, k\sigma) - L(x, y, \sigma) \end{aligned} \quad (3)$$

In fact, we obtained the difference-of-Gaussians pyramid by taking subtraction between the adjacent two layers.

The scale coordinate of keypoints:

$$\sigma(o, s) = \sigma_0 2^{o + \frac{s}{S}} \quad o = 0, 1, \dots, O-1, s = 0, \dots, S+2 \quad (4)$$

The scale of a particular layer:

$$\sigma_{oct}(s) = \sigma_0 2^{\frac{s}{S}} \quad s = 0, \dots, S+2 \quad (5)$$

Detect scale-invariant interest points from scale-space extrema

Local
Feature
Extraction

The Taylor expansion of $D(X)$ is as follows:

$$D(X) = D(X) + \frac{\partial D^T}{\partial X} X + \frac{1}{2} X^T \frac{\partial^2 D}{\partial X^2} X \quad X = (x, y, \sigma)^T \quad (6)$$

Deal with the derivative and let it equal 0. We can obtain the offset of extrema:

$$X_1 = -\frac{\partial^2 D^{-1}}{\partial X_1^2} \frac{\partial D}{\partial X_1} \quad (7)$$

and

$$D(X_1) = D + \frac{\partial D^T}{\partial X_1} X_1 \quad (8)$$

If $|D(X_1)| < 0.3$, throw it.

Detect scale-invariant interest points from scale-space extrema

Local
Feature
Extraction

To suppress such points, which will be less useful for matching. We formulate the Hessian matrix:

$$H = \begin{bmatrix} D_{xx} & D_{xy} \\ D_{xy} & D_{yy} \end{bmatrix}$$

$$Tr(H) = D_{xx} + D_{yy} = \alpha + \beta \quad (9)$$

$$Det(H) = D_{xx}D_{yy} - (D_{xy})^2 = \alpha\beta \quad (10)$$

The new coordinate is based on the orientation of interest point.

$$\begin{bmatrix} x' \\ y' \end{bmatrix} = \begin{bmatrix} \cos \theta & -\sin \theta \\ \sin \theta & \cos \theta \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix}$$

Allocate sampling points

Local
Feature
Extraction

Rotated sampling points was allocated to $4 * 4$ regions.
The new coordinate is:

$$\begin{bmatrix} x'' \\ y'' \end{bmatrix} = \frac{1}{3\sigma_{oct}} \begin{bmatrix} x' \\ y' \end{bmatrix} + \frac{d}{2}$$

The gradient can be computed by Gaussian weighted model
as $\sigma = 0.5d$:

$$w = m(a + x, b + y) e^{-\frac{(x')^2 + (y')^2}{2\sigma(0.5d)^2}} \quad (14)$$

a, b is the coordinate in Gaussian pyramid.

Estimate the dominant orientation

Angle: $\frac{\pi}{3}$.

Radius: $6s$ (s is the scale at which the interest point was detected).

Calculate the Haar-wavelet responses in x and y direction.
The maximum sum of all responses is the dominant orientation.

Compute descriptor

Construct a square region (20s) aligned to the selected orientation. $4 * 4$ square sub-regions, $5 * 5$ regularly spaced sample points.

Compute descriptor

We call dx the Haar wavelet response in horizontal direction and dy the Haar wavelet response in vertical direction.
Vector $\mathbf{v} = (\sum dx, \sum |dx|, \sum dy, \sum |dy|)$
